What Educational Psychology Tells Us About Student Success

Hillary H. Steiner, Ph.D.
Associate Director for SoTL, CETL
Professor of Educational Psychology, Dept of Psychological Science
Three Recommendations from Educational Psychology For Student Success:

1. Be strategic to amplify memory.
2. Be reflective and goal-directed about learning (metacognition).
How can we help students to be strategic to amplify memory?
What strategies do our students use to learn, and do they work?

"Although individual differences occur in effective strategy use, with some students using effective strategies that contribute to their achievement, many students not only use relatively ineffective strategies (e.g., rereading), but believe that they are relatively effective." (Bjork, Dunlosky, & Kornell, 2013, p. 423)

Dunlosky, et al. (2013)

This hasn’t changed in recent years (Rinella & Putnam, 2022).
Help students understand (and overcome) the **choke points** of the memory system (Chew, 2021).
Good learning happens when we practice retrieving information from long-term memory (Karpicke, 2012)

A few ways to encourage this:

- **Low-stakes quizzes** (Atabek Yigit, Balkan Kiyici, & Çetinkaya, 2014)
- **Student-generated test questions** (Doyle, Buckley, & McCarthy, 2020)
- **Online lecture mini-quizzes** (Szpunar, et al., 2013)
- **Teaching others without the use of notes** (Koh, et al., 2018)
How can we help students to be reflective and goal-directed about their learning?
Metacognition
(Flavell, 1979; Schraw, 1996)

“Thinking about your thinking”

- Planning your learning strategies
- Monitoring how your learning is going
- Evaluating how you did and what you’ll do next time
Metacognition
Your Life Hack for Success in College

Have you ever been reading a textbook and suddenly realized you have no idea what you read? Have you ever received a test back and realized that you should have used a different strategy for studying? If so, you’re already practicing metacognition. Metacognition involves being aware of your own thought processes—things like:

- Planning and controlling which strategies you use to learn,
- Monitoring what you do and don’t know (and what to do about it), and
- Reflecting on which learning strategies worked for you, and which didn’t.

Dr. Saundra McGuire, who has written about this topic, describes metacognition like a brain outside of your real brain that’s looking in to see what your real brain is doing and how well it’s doing it. Some students do this naturally, but for those who don’t, it can be learned. So, how can you learn to be more metacognitive? By practicing the art of thinking about your thinking.

Flip this page over to discover some metacognitive strategies that are used by successful college students. As you practice these strategies, do some thinking about your own thinking by reading more about why these strategies work. Gaining knowledge about how you learn and learning to control your own thinking is powerfully motivating... and may just be your best life hack for succeeding in college.

## Sample Metacognitive Strategies

<table>
<thead>
<tr>
<th>Strategies for Reading</th>
<th>What To Do</th>
<th>Why It Works</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Spend five minutes: Observe the reading, looking at the headings and subheadings. If there are questions at the end of the chapter, see if you can answer them.</td>
<td>It activates your prior knowledge and helps you connect new knowledge to what you already know.</td>
</tr>
<tr>
<td></td>
<td>Write notes in the margins of the text, noting connections with things you’ve learned before, summaries, diagrams, or pictures of key points in your own words; and questions you still have. Use sticky notes if you prefer not to write on your text.</td>
<td>It keeps you on task, and ensures that you’re accessing your own understanding, rather than memorizing.</td>
</tr>
<tr>
<td></td>
<td>Teach someone else the material in your own words.</td>
<td>It forces you to consider what’s important, and to explain things as if the topic was new to you.</td>
</tr>
<tr>
<td>Strategies for Note-Taking</td>
<td>Print your instructor’s slides or notes, if provided, and bring them to class. Take your own notes, by hand and in your own words, alongside your instructor’s. Abbreviate and paraphrase!</td>
<td>Enables you to focus on your own thinking, rather than writing down everything your instructor is saying.</td>
</tr>
<tr>
<td></td>
<td>Any time you encounter something you’re not sure you understand, stop and come back to it later. If you need help understanding it, visit your instructor during office hours.</td>
<td>It ensures you’re monitoring whether or not you understand the material, and prevents you from missing anything important.</td>
</tr>
<tr>
<td>Strategies for Test Preparation</td>
<td>Space out your studying over several days. Replace cramming sessions with short, more frequent study sessions. Use aids like flashcards wisely. Don’t copy definitions from the text—write them in your own words and include real-life examples. Critique yourself by predicting the questions that will occur on the test. Create a practice test, and answer your own questions (or trouble with a friend). Reorganize and synthesize your notes, combining textbook and class notes, and organizing them into charts or concept maps. Do not simply re-copy your notes!</td>
<td>It requires you to think about the information frequently, and in different ways, which makes it stick.</td>
</tr>
<tr>
<td></td>
<td>Make a judgment call on each question. How confident are you in your answer? Start the questions that worry you, and revisit them before you submit your test. Predict your grade before you receive your test back, then compare your prediction with the grade you receive. When your test is returned to you, spend a few minutes reflecting on your performance. Are there patterns to your mistakes? Which strategies worked for you? Which didn’t?</td>
<td>It requires you to evaluate what you know and don’t know, and gives you a record of your pattern of answers. It requires you to evaluate your accuracy in predicting what information is important, and which strategies will enable you to learn best. Critiquing your own learning strategies enables you to plan for future changes in your study habits.</td>
</tr>
</tbody>
</table>

This **metacognition menu** offers suggestions for instructors seeking to embed metacognition into their courses.  
Note that some activities are linked to additional information about the activity.

<table>
<thead>
<tr>
<th>What?</th>
<th>When?</th>
<th>Where?</th>
<th>How?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pre-Assessment</td>
<td>Beginning of semester</td>
<td>Courses that build on previous courses</td>
<td>Create a no-stakes pre-test tied to learning outcomes so students are aware of what they don’t know.</td>
</tr>
<tr>
<td>Strategy Reflection</td>
<td>Beginning of semester</td>
<td>Any course</td>
<td>Ask students to reflect on the strategies they’ve used in the past to learn similar material. Were those strategies effective? How might they be adapted for the current course?</td>
</tr>
<tr>
<td>Student Testimonial</td>
<td>Beginning of semester</td>
<td>Any course</td>
<td>Invite a former student who was successful in the course to share their metacognitive strategies.</td>
</tr>
<tr>
<td>Introduce Metacognition</td>
<td>Beginning of semester</td>
<td>Any course</td>
<td>Use a handout like the one linked here to explain metacognition and offer examples of metacognitive behaviors. If you have more time, assign Stephen Chew’s “How to Study” video series for discussion and reflection.</td>
</tr>
<tr>
<td>Participatory Pedagogy (also known as Students-as-Partners)</td>
<td>Throughout semester</td>
<td>Any course, but easier to implement in small courses</td>
<td>Actively involve students in contributing to the curriculum, integrating and articulating their own goals.</td>
</tr>
<tr>
<td>Specifications Grading</td>
<td>Throughout semester</td>
<td>Any course</td>
<td>Use this grading system to encourage students to plan and self-direct their learning.</td>
</tr>
</tbody>
</table>
How can we help students be mindful of their motivation?
Expectancy-Value Theories of Motivation
(e.g., Wigfield, 1994; Flake, et al., 2015)

Degree to which you expect to be successful

Value (whether tangible or intangible) the task has

Cost the activity has

Your motivation
Examples of Ways to Increase Motivation

• Provide mastery activities that allow students to build up small “wins” (Betz & Schifano, 2000)

• Provide ample and specific positive feedback and encouragement (Vogt, 2008)

• Create utility value assignments that directly relate the course content to something of value to the student (Canning, et al., 2018; Soicher & Becker-Blease, 2020)

• Ask students to reflect on how they’ve overcome challenges, and share these reflections with future classes (Rosenzweig, et al., 2020)
Science of Learning

Many teaching recommendations are based on findings from the science of learning, which has its basis in educational and cognitive psychology. The Scholarship of Teaching and Learning (SoTL) also often draws from and is framed by key concepts in these fields, yet for teachers and researchers outside these disciplines, the search for appropriate literature can seem very time-consuming.

If you are new to this literature, the following secondary sources may be helpful as "entry points: " Scroll to the accordion list for research and meta-analyses on common topics of interest for faculty. To improve your teaching consider introducing your students to concepts like metacognition with help from this student handout, and discover ideas for incorporating it into your teaching through this metacognition menu. For more information about how the science of learning can inform your teaching or SoTL projects, please contact Hillary Steiner, Associate Director for SoTL and Professor of Psychological Science.

Books and Articles:

E-Books and Websites:

- SoTL Annotator provides a crowdsourced annotated bibliography on dozens of teaching and learning topics.
- Benassi, Overson, and Hakala’s (2014) ebook on applying the science of learning offers a useful collection of chapters on a variety of topics.
- Improve with Metacognition offers information and commentary about using the principles of metacognition in the classroom.
- RetrievalPractice.org explains and promotes retrieval practice as a key aspect of learning.
- The Learning Scientists are a group of cognitive psychologists who share their insights on learning through blogs, books, podcasts, and downloadable materials.
- Taking Learning Seriously includes information, learning guides and teaching tools focused on translating cognitive science into practice.
- Elizabeth and Robert Bjork’s Learning and Forgetting Lab at UCLA has a collection of excellent primary sources on learning, memory, metacognition, and more.

For a deeper dive into the science of learning literature, consider these recommended articles and books:

- Learning and Studying (General)
- Self-Regulated Learning and Metacognition
- Attention and Multitasking
- Learning from Mistakes and Failure
- Retrieval Practice, Self-Quizzing and Learning-by-Teaching
- Mindset and Motivation

<tr>
<th>CETL Supports SoTL at KSU in the Following Ways:</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>SoTL Manuscript Completion Program</strong></td>
<td>Hybrid program that provides funding for participants to complete writing goals in consultation with peers and CETL staff.</td>
</tr>
<tr>
<td><strong>SoTL Travel Funds</strong></td>
<td>Competitive travel funding program for faculty whose SoTL work has been accepted for presentation at a conference.</td>
</tr>
<tr>
<td><strong>SoTL Micro-Credentials</strong></td>
<td>Digital badges that can be earned by KSU faculty, staff, and students, demonstrating varying levels of SoTL knowledge and skills.</td>
</tr>
<tr>
<td><strong>Hopscotch 4-SoTL</strong></td>
<td>A web tool that assists users in developing a well-informed SoTL research design.</td>
</tr>
<tr>
<td><strong>SoTL Summit Conference</strong></td>
<td>An annual international SoTL conference coordinated by KSU CETL.</td>
</tr>
<tr>
<td><strong>SoTL Listserv</strong></td>
<td>A SoTL Listserv for the KSU community that provides updates on SoTL opportunities at KSU and beyond.</td>
</tr>
<tr>
<td><strong>Directory of Journals</strong></td>
<td>A directory of journals that publish SoTL research.</td>
</tr>
<tr>
<td><strong>Directory of Conferences</strong></td>
<td>A directory of conferences that focus on teaching in higher education.</td>
</tr>
<tr>
<td><strong>SoTL Consultations</strong></td>
<td>Individual consultations with faculty: virtual or in-person in the IRML-CETL Lab. The Lab can also be reserved for self-guided use in conjunction with the Hopscotch 4-SoTL web tool.</td>
</tr>
<tr>
<td><strong>SoTL Web Resources</strong></td>
<td>Frequently updated resources on SoTL frameworks, methodology, funding sources and more.</td>
</tr>
